                                                                                                                                                                                                             Sequences AAS45296-AAS45520 represent chemically pretreated genomic DNA molecules associated with the cell cycle and specific PCR primers of the invention. The sequences are useful for detecting the methylation state of all CpG dinucleotides in a sequence and therefore for analysing associated diseases. By analysing cytosine methylations in the pretreated DNA, genetic and/or epigenetic parameters for the diagnosis and therapy of existing diseases or the predisposition to specific diseases can be ascertained. The parameters may be compared to another set of genetic and/or epigenetic parameters, the differences serving as basis for diagnosis and/or prognosis events which are disadvantageous to patients. The sequences of the invention are useful for the diagnosis and therapy of HIV infection, neurodegenerative disorders, graft-versus-host disease, arthritis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          15-MAR-2000;

```
CC The invention relates to a nucleic acid, which comprises a segment of the CC chemically pretreated DNA of genes associated with DNA transcription from CC one of 346 sequences, and an oligomer; in particular an oligonucleotide CC or peptide nucleic acid (PNA)-oligomer that hybridises to or is identical to the chemically pretreated DNA of genes associated with DNA cytosine methylation state and/or single nucleotide polymorphisms (SNPs) cytosine methylation state and/or single nucleotide polymorphisms (SNPs) diagnosing or treating diseases associated with DNA transcription CC (particularly with the methylation status), e.g. adenosine deaminase cytosical disorders, immunological disorders year syndrome, comerculosis, developmental disorders, psoriasis, Rieger's syndrome, cytoberulosis, developmental disorders, psoriasis, Rieger's syndrome, construction, hypertension, anglogenesis, erythropolesis, congenital heart cytoberulos, cyto

The sequences are useful for detecting the methylation state of all CpG dinucleotides in a sequence and therefore for analysing associated diseases. By analysing cytosine methylations in the pretreated DNA, genetic and/or epigenetic parameters for the diagnosis and therapy of existing diseases or the predisposition to specific diseases can be ascertained. The parameters may be compared to another set of genetic and/or epigenetic parameters, the differences serving as basis for diagnosis and/or porgonosis events which are disadvantageous to patients. The sequences of the invention are useful for the diagnosis and therapy of the parameters are useful for the diagnosis and therapy of the prognosis events which are disadvantageous to patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Designing primers and probes for analysing diseases associated with cytosine methylation state e.g. arthritis, cancer, aging, arteriosclerosis comprising fragments of chemically modified genes associated with cell cycle -

New nucleic acids or oligomers, useful for diagnosing or treating diseases associated with DNA transcription, e.g. immunological disorders, Werner syndrome, psoriasis, myocardial infarction, sol: disorders, Werner syndrome, tumours or cancer solid

Claim 1: SEQ ID No 100; 32pp; English

The invention relates to a nucleic acid, which comprises a segment of the CC chemically pretreated DNA of genes associated with DNA transcription from CC one of 346 sequences, and an oligomer, in particular an oligonucleotide corpeptide nucleic acid (pNA)-oligomer that hybridises to or is identical corpeptide nucleic acid (pNA)-oligomer that hybridises to or is identical corpeptide nucleic acid power probes are useful for detecting the CC transcription. The set of oligomer probes are useful for detecting the CC in a chemically pretreated genomic DNA. The nucleic acids are useful for CC diagnosing or treating diseases associated with DNA transcription corporated vith DNA transcription corporated infection, retroviral infection, searly syndrome, corporated disorders, immunological disorders, psoriated with DNA transcription corporated disorders, psoriatis, Reger's syndrome, corporated processes, myelodysplastic syndrome, myocardial corporated processes, arthritis, polyglutamine disorders, social tumours associated genomic DNA molecules of the invention.

CC Note: The sequence data for this patent did not form part of the printed corporated per printed disorders and directly from the corporate and patent office.

The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AIDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psorlasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid comprising for diagnosis and treatm

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and leukaemia, Alzheimer's disease, AIDS, epilepsy, neurofibromatosis, theumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                               Nucleic acid comprising fragment of chemically modified for diagnosis and treatment of diseases associated with cytosine methylation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                30-JUN-2000;

The present invention relates to chemically modified DNA sequences of condified using a solution of bisulphite, bydrogen sulphite or disulphite. Also disclosed are oligonucleotides and/or PNA oligoners of or detecting the cytosine methylation state (CPG islands) of these epigenetic parameters of genes associated with signal transduction. CC contain DNA, e.g. cell lines, biopsies, blood, sputum, stool, urine, ceyes, intestine, kidney, brain, heart, prostate, lung, breast or liver, ceyes, intestine, kidney, brain, heart, prostate, lung, breast or liver, cc sequences of the invention are useful for the diagnosis and therapy of cancer. ABK31158 ABK31545 represent chemically pretreated genomic DNA con be dead of the diagnosis and transduction, or their complementary sequences of the invention are useful for the diagnosis and therapy of cancer. ABK31158 ABK31545 represent chemically pretreated genomic DNA cc their complementary sequences associated with signal transduction, or contain transduction, or contain transduction, or their complementary sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match 2.5%;

                                                       Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               nucleic search, using sw model
